Dlink DNS-323

Fun_Plug

March 31, 2013 - Originally was going to use, OARM but according to the same page it is obsolete and to use OABI 0.7 instead.

Should make a copy of all source binaries and packages.

Amendments to Instructions

The download I used already had the sources in Slacker and most tools already installed.

When I look at the fun_plugin script file it looks like you need to keep it around even after installation.

For the user **remotebackup**,

- Added through the web interface.
- Changed to real shell using commands.
- Command **usermod -a -G backup remotbackup** did not work until I manually modified groups file as things were a bit off for the **backup** group.
- Made sure to execute command to save passwd, groups ect..
- Added in private key per normal.
