

# SSH Terminal Via Browser

## Research

Keep in mind most of the servers I use already have this as a console feature.

<http://anyterm.org/demos.html> - has demos of the various solutions.

[AjaxTerm](#) - python based, claims to be easy to install. Looks very similar to products I have seen used by hosting providers. Has flashing network indicator.

[AnyTerm](#) - Looks comprehensive and has a drop down. Also [provided as a service](#) so you don't have to install their software.

[Shell in a Box](#) - ".. exports arbitrary command line tools to a web based terminal emulator". (I believe this mean it is all executed on the client).

More comparisons - <http://anyterm.org/compared.html#secid2250882>
