

Changing Footer

<http://confluence.atlassian.com/display/DOC/Editing+the+Footer> - explains how to modify the property files inside of a jar file.

Instead, I just keep it simple, edit `./confluence/decorators/includes/footer-content.vm` and comment the first instance of,

```
$action.getText('licensefooter.community', [$action.getText('url.atlassian')  
, $action.getText('hitcounter.community'), $license.organisation])<br>
```

using `## text ##`

```
##$action.getText('licensefooter.community', [$action.getText('url.atlassian')  
, $action.getText('hitcounter.community'), $license.organisation])##<br>
```

Just refresh your browser to see the change take effect.

I also found that commenting out the following gives more space,

```
<!--ul id="poweredby">  
  <li  
class="noprint">$action.getText('powered.by.atlassian.confluence',  
    [$action.getText('url.atlassian.software.confluence.footer'),  
    "<span  
id='footer-build-information'>$generalUtil.versionNumber</span>",  
    $action.getText('url.enterprise.wiki.footer') ])</li>  
  <li  
class="print-only">$action.getText('printed.by.atlassian.confluence', ["$ge  
neralUtil.versionNumber"])</li>  
  <li class="noprint"><a  
href="$action.getText('url.bug.feature.request')"  
class="hover-footer-link">$action.getText('bug.feature.request')</a></li>  
  <li class="noprint"><a  
href="$action.getText('url.footer.atlassian.news')"  
class="hover-footer-link">$action.getText('footer.atlassian.news')</a></li>  
</ul-->
```
