### **Removing Hot Spots**

Here the technique I find has the best control. It is slightly modified from this video.

#### Backup on NAS "Shine Hotspots on Skin (720 HD).mp4"

- Create a new layer and change mode to Darken and set opacity to ~72%
- 2. Zoom in
- Use clone tool selecting a good area and draw on with the following clone tool settings,
  - a. Select a brush with a soft edge effect
  - b. Set mode to normal
  - c. Opacity to 50%
  - d. Flow default of 100% is good
  - e. Current and below (for the layer selection)
- 4. Trick is to use as big a brush as possible to fill the white area
- 5. Don't need to be too accurate as this is layer
- 6. Finally copy merged to create a new layer and apply any additional effects

This is the gaussion blur technique and generally works well too.

- 1. Duplicate layer
- 2. Filter Blur, Guassian Blur,
  - a. Turn up radius until shiny spots disappear usually 9
- 3. Filter, Add Noise
  - a. Amount between 2 and 3
  - b. Guassian
- 4. Select Eraser,
  - a. Turn hardness down to 0
  - b. Adjust brush size as needed
- 5. Erase top layer where the glare exists

Here is a mask based tutorial which I have yet to try.

## **Masking Key Shortcuts**

ALT and Click Mask - Toggle Show Mask Only

ALT-SHIFT Click Mask - Toggle Show Mask with Image in Pink Overlay
