

# JavaScript

## Debugging with JavaScript

`javascript:moveTo(0,0);resizeTo(1024,768);` - change the current browser window to the specified size. Without the `moveTo` depending on the location of the browser window it may constrain itself by the edge of the screen.

`javascript:alert(document.cookie);` - Shawn's trick to show all cookies in browser.

Explains the console - <http://buildinternet.com/2010/12/debugging-javascript-behind-the-scenes/>

## Useful JavaScript Tricks

### Resolution

In the browser address bar,

To determine the actual size of the browser window, use the following properties:

Internet Explorer (backward-compatibility mode):

`document.body.offsetWidth`, `document.body.offsetHeight`

Internet Explorer (standards mode, `document.compatMode==='CSS1Compat'`):

`document.documentElement.offsetWidth`, `document.documentElement.offsetHeight`

Most other browsers:

`window.innerWidth`, `window.innerHeight`
